

### Self-drilling screws with mushroom head, square recess and zinc plated

The QS self-drilling screws with mushroom head are ideal for fastening parts to a metal plate or metal substructure. These screws are finished with a white/blue zinc plated coating that gives them limited resistance to corrosion. The large mushroom head provides a neat finish on the outside while the flat underside of the head provides a larger contact surface and pushes the attached part nicely against the substructure.

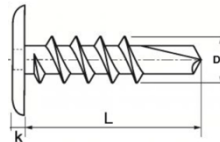

The square recess allows the screws to be easily processed : perfect bit take-up, one-handed assembly possible, more torque possible and no wobbling screw.

Thanks to the integrated drill point, drilling, threading and fastening is done in one movement. This significantly reduces processing time. The drilling capacity depends on the drill point length and the screw diameter.

These screws have a CE mark.
